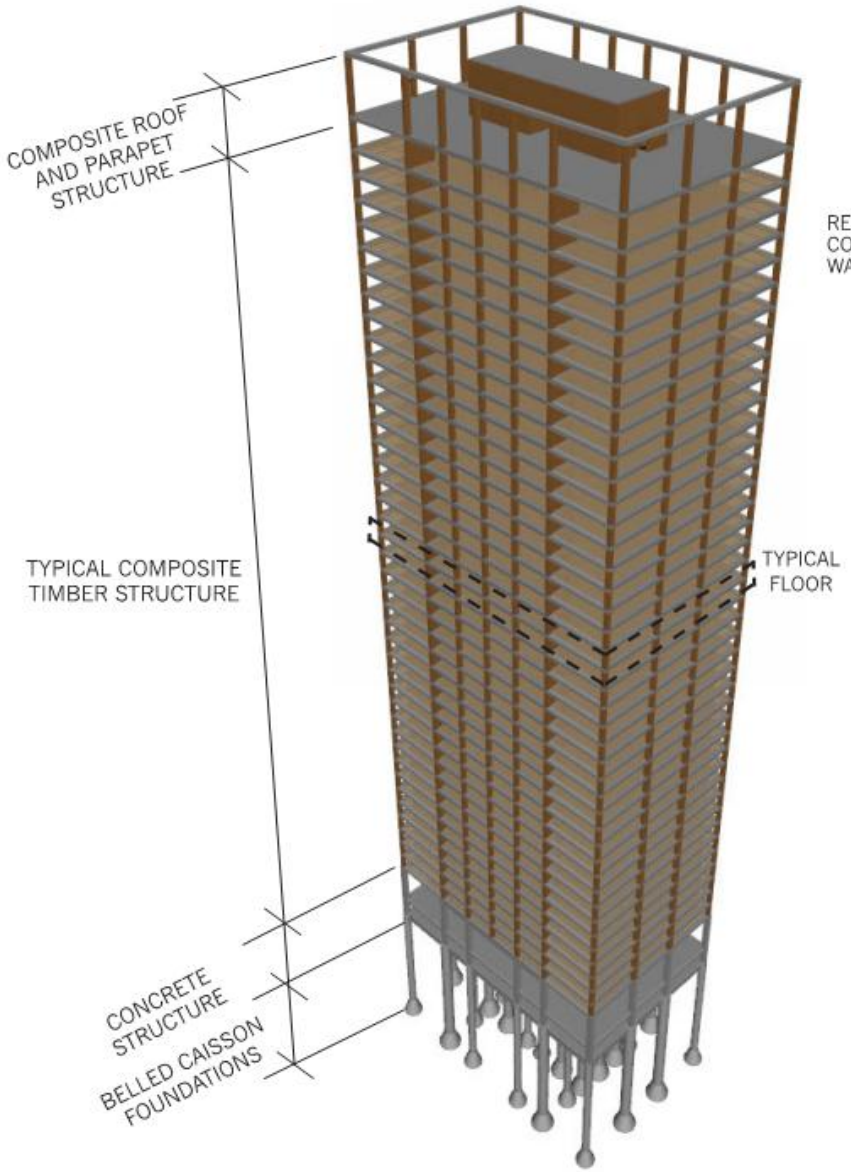
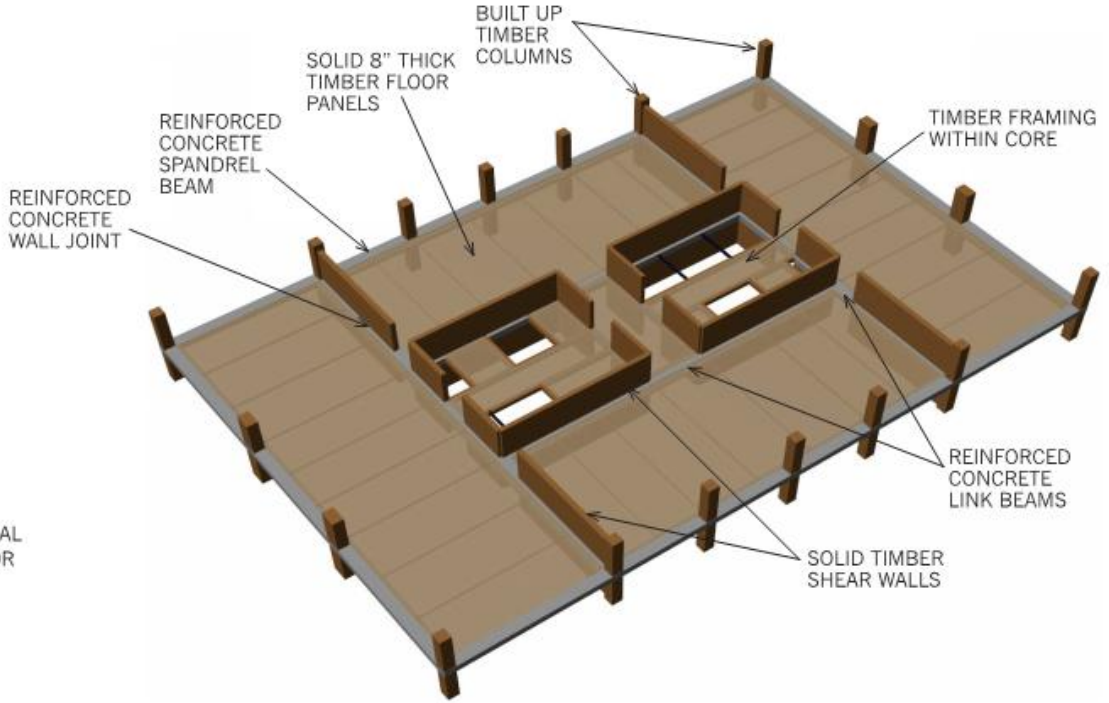
What is Mid-Rise?

(5 to 11 stories)



OVERALL STRUCTURE



TYPICAL FLOOR STRUCTURE

STRUCTURAL SYSTEM DESCRIPTION

THE STRUCTURAL SYSTEM PROPOSED IS THE CONCRETE JOINTED TIMBER FRAME. THIS SYSTEM CONSISTS OF SOLID MASS TIMBER PRODUCTS FOR THE PRIMARY MEMBERS SUCH AS THE FLOOR PANELS, COLUMNS, AND SHEAR WALLS. THE PRIMARY MEMBERS ARE CONNECTED WITH STEEL REINFORCING THROUGH CONCRETE JOINTS.

THE GRAVITY FRAMING SYSTEM UTILIZES SOLID 8" THICK TIMBER FLOOR PANELS WHICH SPAN BETWEEN THE SHEAR WALL CORE AT THE CENTER OF THE BUILDING AND COLUMNS AT THE PERIMETER OF THE BUILDING. THE ENDS OF THE FLOOR PANELS ARE RESTRAINED FROM ROTATING BY THE CONCRETE JOINTS AND VERTICAL STRUCTURE. THIS CONNECTION SCHEME ALLOWS THE FLOOR SYSTEM TO BE MORE ECONOMICAL.

THE LATERAL LOAD RESISTING SYTEM UTILIZES SOLID TIMBER SHEAR WALLS WHICH ARE COUPLED WITH REINFORCED CONCRETE LINK BEAMS. THE SYSTEM IS DESIGNED TO BE EFFICIENT IN RESISTING NET UPLIFT DUE TO WIND OVERTURNING.

ESTIMATED QUANTITIES

SUB AND SUPERSTRUCTURE:
- TIMBER: 0.80 cu.ft/sf
- CONCRETE: 0.25 cu.ft/sf
- REINFORCEMENT: 1.7 psf
- STRUCTURAL STEEL: 0.3 psf

FOUNDATIONS:
- CONCRETE: 0.09 cu.ft/sf
- REINFORCEMENT: 0.1 psf

Architectural Coordination

ONE-HOUR FLOOR/CEILING, ROOF/CEILING ASSEMBLIES

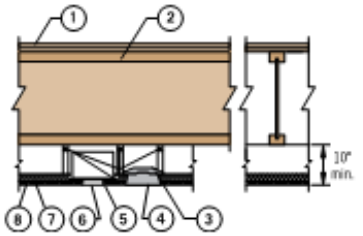
Lightweight concrete or approved gypsum concrete topping with appropriate sheathing can be substituted for the decking material shown in any of these assemblies.

Assembly A

Intertek
WNR FCA 60-11

ICC-ES ESR-1153

1. Double wood floor
2. TJI® joist with minimum 1½" flange depth (see **TJI® Joist Specifications** table on page 16 for flange sizes)
3. Fixture protection
4. 24" x 48" recessed light fixture
5. Cold-rolled channels
6. 12" air diffuser
7. Minimum 1"-thick (4 pcf minimum) mineral wool blankets
8. ⅝" acoustical panels, 24" x 24" or 24" x 48", supported by an approved exposed fire-rated suspension system



Assembly B

Intertek
WNR FCA 60-01
WNR FCA 60-03

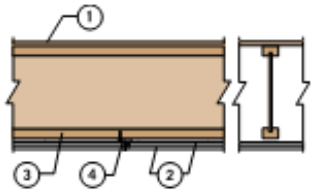
PFS FA-1

ICC-ES ESR-1153

1. 48/24 tongue-and-groove, span-rated sheathing (Exposure 1)
2. Two layers ⅝" Type X gypsum board
3. TJI® joist
4. Resilient channels (optional)*

Optional: Minimum 3½"-thick glass fiber insulation or non-combustible insulation, rated R-30 or less.*

***Resilient channels are required when insulation is used.**

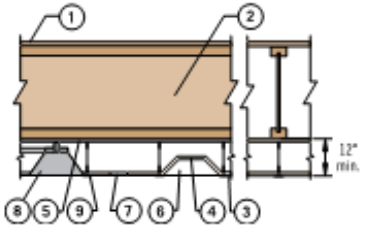


Assembly C

ICC-ES ESR-1153

1. 48/24 tongue-and-groove, span-rated sheathing (Exposure 1)
2. TJI® joist
3. ⅝" ceiling panels, 24" x 24"
4. Fixture protection
5. ½" Type C gypsum board or ⅝" Type X gypsum board
6. 24" x 48" recessed light fixture
7. 6" x 12" opening for return air
8. 12" diameter diffuser opening
9. Steel suspension grid

Note: Additional restrictions apply to Intertek's version of this listing. Refer to WNR FCA 60-08 for additional information.



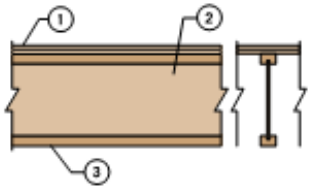
ONE-HOUR FLOOR/CEILING, ROOF/CEILING ASSEMBLIES

Lightweight concrete or approved gypsum concrete topping with appropriate sheathing can be substituted for the decking material shown in any of these assemblies.

Assembly E

ICC-ES ESR-1153

1. Double wood floor or single layer of 48/24 tongue-and-groove span-rated sheathing (Exposure 1)
2. TJI® joist
3. An approved ceiling system that will provide a 40-minute finish rating

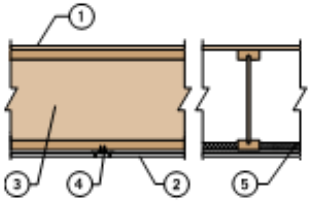


Assembly F

Intertek
WNR FCA 60-07

ICC-ES ESR-1153

1. 48/24 tongue-and-groove, span-rated sheathing (Exposure 1)
2. ⅝" Type C gypsum board
3. TJI® joist with a minimum depth of 11⅞" and a minimum flange size of 1½" thick x 3½" wide (see **TJI® Joist Specifications** table on page 16 for flange sizes). Joists spaced at 24" on-center, maximum.
4. Resilient channel at 16" on-center
5. Minimum 11/2"-thick (2.5 pcf minimum) mineral wool batts



Typical detail for butt joints perpendicular to framing members

TWO-HOUR FLOOR/CEILING, ROOF/CEILING ASSEMBLY

Lightweight concrete or approved gypsum concrete topping with appropriate sheathing can be substituted for the decking material shown in any of these assemblies.

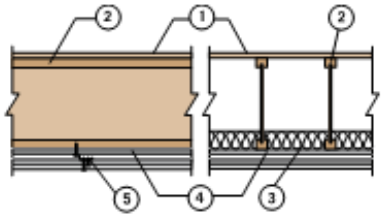
Assembly G

Intertek
WNR FCA 120-3

ICC-ES ESR-1153

Assembly G is typically used for garage/living unit separation

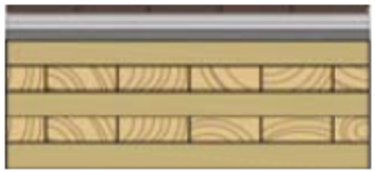
1. 48/24 tongue-and-groove, span-rated sheathing (Exposure 1)
2. TJI® joist, 24" on-center maximum
3. Optional glass fiber insulation, unfaced batts, 3½" thick in plenum, supported by stay wires 12" on-center and centered on joist bottom flanges
4. Three layers of ⅝" Type C gypsum board
5. Resilient channels at 16" on-center located between first and second layers of gypsum board



Typical resilient channel and gypsum board attachment

NORDIC'S CLT FRR

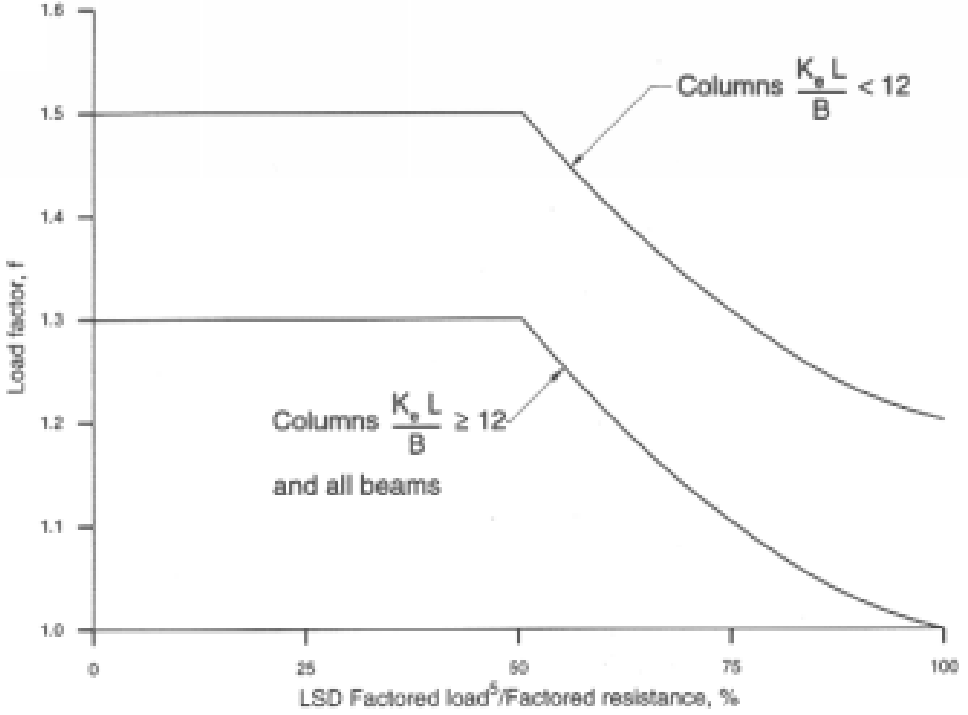
P2	- carpet or floating flooring, about 2/5 in. - resilient underlayment (rubber mat or textured felt), 0.12 in. - at least 15.6 lb/ft^2 wet topping (concrete, gypcrete, gypsum) - resilient underlayment (2/5 in. rubber mat, 3/4 in. textured felt, or 1/2 in. low density wood fiberboard) - cross-laminated timber 6-7/8 in.	1,5 h	> 53[4]
P2.1	+ 1 layer 5/8 in. Type X gypsum board	2 h	> 53[4]



P3	- carpet or floating flooring, about 2/5 in. - resilient underlayment (rubber mat or textured felt), 0.12 in. - at least 25 kg/m^2 dry topping (20 mm Fermacell, cement fibreboard, or Fibrerock) - resilient underlayment (2/5 in. rubber mat, 3/4 in. textured felt, or 1/2 in. low density wood fiberboard) - cross-laminated timber 6-7/8 in.	1,5 h	> 48[4]
P3.1	+ 1 layer 5/8 in. Type X gypsum board	2 h	> 48[4]

P4	- cross-laminated timber 6-7/8 in.	1,5 h	39[5]
P4.1	- cross-laminated timber 6-7/8 in. - sound insulation clips of 4 in. high - metal hat channels, at min. 16 in. o.c. - sound insulation material, 4 in. - 2 layers 1/2 in. Type X gypsum board	2 h	64

Fire Rating of Glulam



1hr FRR

Beam – 175x304

Column – 315 x 304

$$FRR = 0.1fB\left[4-2\frac{B}{D}\right]$$

for beams exposed to fire on 4 sides,

$$FRR = 0.1fB\left[4-\frac{B}{D}\right]$$

for beams exposed to fire on 3 sides,

$$FRR = 0.1fB\left[3-\frac{B}{D}\right]$$

for columns exposed to fire on 4 sides,

$$FRR = 0.1fB\left[3-\frac{B}{2D}\right]$$

for columns exposed to fire on 3 sides,

The case of Timber vs Steel for fire performance.

During a fire a room temperature rises from 70 °F (21 °C) to 1100 °F (600 °C).

the advisability of relieving at least to a certain extent the glaring monotony of all white floors and walls.

WAREHOUSE BUILDINGS.

In building a modern warehouse attention must be paid to the three classes of construction, commonly known as "ordinary," "mill" and "slow-burning" construction. All are intended to safely sustain a load of 100 pounds per square foot of floor space, although this capacity may be indefinitely increased as the purposes for which the building is intended vary.

The term "ordinary construction" is defined in the revised Toronto building by-law as meaning "a building with wood joists and wood or iron posts, columns and beams, which are not protected with fire-resisting coverings, but having the external and party walls constructed of brick, stone or some other incombustible material, the roof of such buildings being covered with tin, iron, copper, slate, tile, felt and gravel or other material of an incombustible nature."

On the other hand, "mill construction" is defined as meaning a "building in which all the wooden girders and joists, supporting floors and roof, have a sec-

Where planks are set on edge and are not over two inches thick, with a matched wearing floor above, the tongue and groove or splice may be omitted; in such cases the planks shall be well spiked at intervals of 15 inches with spikes of sufficient length to penetrate two-thirds the thickness of the adjoining plank.

The term "slow-burning construction," according to the by-law, "shall apply to all buildings in which mill construction is used and in which the structural members, which carry the loads and strains which come upon the floors and roofs thereof, are entirely enveloped in incombustible material. This class of building shall have double floors and roof, with one thickness of asbestos paper, weighing not less than 14 pounds each per 100 square feet, between the upper and lower thicknesses of floors and roof. The under side of all floors shall be protected in the same manner as the wood structural members.

Ordinarily the two latter classes of construction are regarded as practically the same, distinction being generally made between the first two only. The joists in all cases have a span of 20 feet from one bearing to the other and in ordinary construction are 3 x 12 inches, spaced 12 inches centre to centre, while those

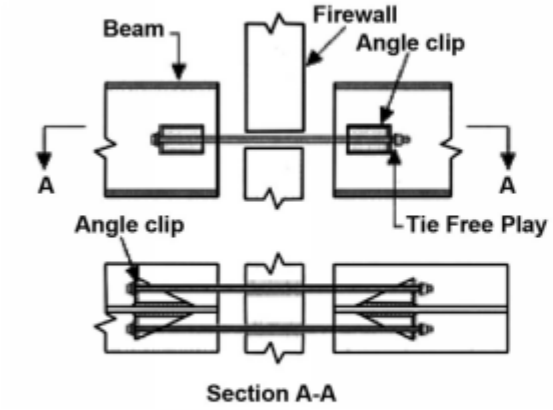
ing frame and the unexposed frame. This can be achieved by using solid wall sections, as illustrated in Figures 5A.8 and 5A.9.

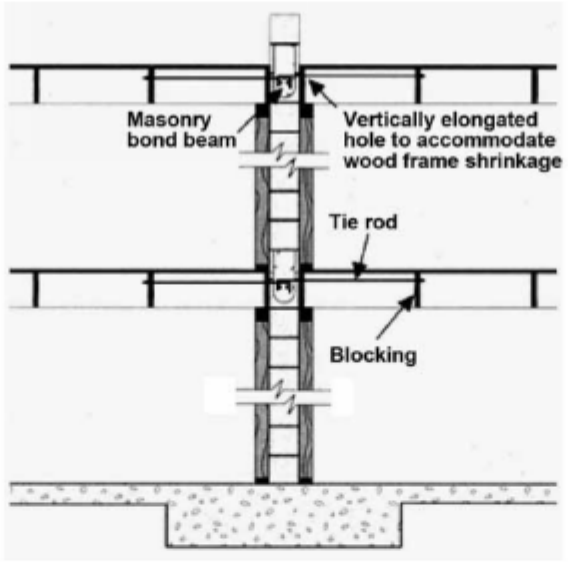
7. Where tied firewalls encase steel columns, expansion of the steel framing members on the fire side of the wall will be resisted by the framing on the unexposed side of the wall. The connection of the columns to the wall should allow for movements which would occur in the protected frame when resisting the sagging force exerted by the fire-exposed frame. This can be achieved by using flexible masonry anchors or by using concrete block units that loosely key into the re-entrant space of the column.
8. In all cases, the firewall itself must be designed to withstand the lateral loads specified in NBCC-10 Article 4.1.5.17.

Figure 5A.20: *Through-Wall Tie, Primary Steel Perpendicular to Tied Firewall*



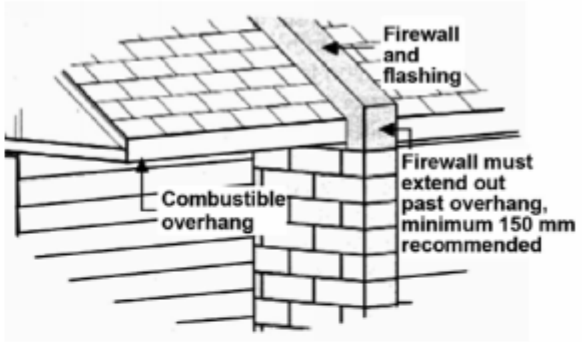
act as a weak link in accordance with Paragraph 15 of Commentary "C" of *"User's Guide—NBC 2010, Structural Commentaries (Part 4 of Division B)"*. The firewall itself must be reinforced and detailed in accordance with Paragraphs 8, 9, 14 and 15 of Commentary "C". This form of construction is typically used in wood frame multi-unit residential buildings where firewalls are used to separate dwelling units or building sections.

Figure 5A.21: *Weak Link Connection Firewall*



An alterative form of the weak link connection can be used where wood floor joists run perpendicular to, and are supported on, the firewall. The ends of the joist should be fire cut as shown in Figure 5A.22. This will enable the floor framing exposed to the fire to disen-

Figure 5A.27d: *Firewall Extension Past Eave*



5A.5.7 Combustible Projections

Combustible projections such as balconies, platforms, stairs and eaves that are located near a firewall can also be ignited by flames or heat that pass around the end of a firewall. Therefore, combustible projections are not permitted within 2.4 m of similar combustible projections, or window or door openings, placed on the opposite side of the firewall. This distance should provide adequate separation to prevent ignition of combustibles [3.1.10.7.(2), NBCC-10] (Figure 5A.28).
